Great empirical success, but limited theoretical justification.

## Generalization Analysis of Neural Networks

Why does the model learned by minimizing the empirical risk on the training data perform well on the testing data?

Training and test error against the number of samples

To guarantee the testing performance, need a small training error and a small generalization gap *simultaneously*.

# Related Works on Generalization Analysis

Overparameterized neural networks

number of learnable parameters > number of training samples Pros Cons

- Allow random initialization.
- 2 Zero training error.

- Consider linearized networks → The training problem is convex.
- On not explain the advantage of deep networks.
- Require a significantly larger number of neurons than that in practice.

- Mean Field: [Mei et al., 2018; Chizat & Bach, 2018; Fang et al., 2019; Nguyen, 2019]
- Neural Tangent Kernel: [Jacot et al., 2018; Allen-Zhu et al., 2019; Du et al, 2019; Zou et al., 2019; 2020].

#### Related works

Model recovery framework

- Assume a fixed network with unknown ground-truth parameter  $\boldsymbol{W}^*$ . The output y is generated by  $\boldsymbol{W}^*$  and the input  $\boldsymbol{x} \in \mathbb{R}^d$ . We aim to estimate  $\boldsymbol{W}^*$  given dataset  $\{\boldsymbol{x}_i, y_i\}_{i=1}^n$ .
- Generalization error of a returned model *W* is measured by ||*W* - *W*<sup>\*</sup>||<sub>F</sub>.
- Solves the nonlinear the empirical risk minimization directly.
  - Landscape analysis: almost locally convex near  ${oldsymbol W}^*$
  - Initialize near  $W^*$  followed by gradient descent.

This line of works includes [Zhong et al., 2017; Zhang et al., 2020a; 2020b; 2021a; 2021b; Fu et al., 2020].

Objective function and population risk function

#### Related works

Pros

- Deal with the network with a fixed number of neurons.
- 2 No linearization of the network.

Cons

- One-hidden-layer neural networks
- 2 Input from the standard Gaussian with zero mean and unit variance.

# Gaussian Mixture Model

- Generalization analysis of neural networks with non-standard Gaussian inputs is less investigated.
- Many practical datasets can be modelled by a mixture of distributions [Li Liang, 2018].
- We formulate a Gaussian mixture model (GMM) as the input distribution.

MNIST [LeCun et al., 1998]

Cifar-10 [Krizhevsky, 2009]

ImageNet [Deng et al., 2009]

イロト 不得下 イヨト イヨト

Q: what is the generalization guarantee when data follow GMM? How does the mean and variance affect the learning performance?

Meng Wang (RPI)

# Problem Formulation

- Input data following GMM:  $\pmb{x} \sim \sum_{l=1}^L \lambda_l \mathcal{N}(\pmb{\mu}_l, \pmb{\Sigma}_l) \in \mathcal{R}^d$
- $\bullet\,$  One-hidden-layer network with ground-truth weights  ${\it I\!V}^*.$

$$\mathbb{P}(y=1|\boldsymbol{x}) = \frac{1}{K} \sum_{j=1}^{K} \phi(\boldsymbol{w}_{j}^{*\top} \boldsymbol{x})$$
(1)

One-hidden-layer networks

・ロン ・四 と ・ ヨ と ・ ヨ と

 $\phi$  is the sigmoid function.

Given n pairs of data {x<sub>i</sub>, y<sub>i</sub>}<sup>n</sup><sub>i=1</sub>, the training problem minimizes the empirical loss

$$f_n(\boldsymbol{W}) = \frac{1}{n} \sum_{i=1}^n \ell(\boldsymbol{W}; \boldsymbol{x}_i, y_i), \qquad (2)$$

where  $\ell$  is the cross-entropy function.

Meng Wang (RPI)

# Algorithm

Gradient Descent with Tensor Initialization

- Input: Training data {(x<sub>i</sub>, y<sub>i</sub>)}<sup>n</sup><sub>i=1</sub>, the step size η<sub>0</sub>;
- Initialization: W<sub>0</sub> ← Tensor initialization method;

3: for 
$$t = 0, 1, \cdots, T - 1$$
 do

4: 
$$\boldsymbol{W}_{t+1} = \boldsymbol{W}_t - \eta_0 \nabla f_n(\boldsymbol{W})$$

- 5: end for
- 6: **Output:**  $W_T = 0$

Tensor Initialization

- Initialize a weight matrix in the local convex region of *W*\*.
- We develop a different tensor construction from that in [Zhong et al., 2017] because of the non-standard-Gaussian input.

イロト 不得下 イヨト イヨト

Vanilla Gradient Descent

#### Main Theoretical Results

#### Theorem 1

Given the samples from  $\{\mathbf{x}_i, y_i\}_{i=1}^n$  satisfying

$$n \ge n_{sc} := poly(\mathcal{K})\mathcal{B} \cdot d\log^2 d \tag{3}$$

for positive value functions  $\mathcal{B}$  and v with high probability, the iterates  $\{\boldsymbol{W}_t\}_{t=1}^T$  returned by Algorithm 1 converge linearly to a critical point  $\widehat{\boldsymbol{W}}_n$  with the rate of convergence v, i.e.,

$$||\boldsymbol{W}_t - \widehat{\boldsymbol{W}}_n||_F \leq v^t ||\boldsymbol{W}_0 - \widehat{\boldsymbol{W}}_n||_F.$$
 (4)

There exists a permutation matrix  $P^*$  such that the distance between  $\widehat{W}_n$  and  $W^*P^*$  is

$$||\widehat{\boldsymbol{W}}_n - \boldsymbol{W}^* \boldsymbol{P}^*||_F \le O\Big(\boldsymbol{K}^{\frac{5}{2}} \cdot \sqrt{d \log n/n}\Big).$$
(5)

# Main Theoretical Results (cont'd)

Corollary 1

When everything else is fixed,

- **(**)  $n_{sc}$  and v increase as the norm of one mean increases.
- Insc and v first decreases and then increases, as the norm of one covariance matrix increases,
- Sample complexity: Θ(d log<sup>2</sup> d), the same order as the case of standard Gaussian inputs in [Zhong et al., 2017; Fu et al., 2020].
- The iterates converge to  $\widehat{W}_n$  linearly.  $\widehat{W}_n$  is close to  $W^*$  with a diminishing distance in n.
- $\bullet\,$  Mean increases  $\rightarrow$  a higher sample complexity and converges slower.
- Variance increase → the sample complexity first decreases and then increases; converges faster first and then slower.

< 白 > ( 何 > ( 三 > ( 三 > ) ) ) ( 三 ) ) ( 三 ) ) ( 三 ) ( 三 ) ( 三 ) ) ( 三 ) ( = )

#### Technical challenges

- Landscape analysis fails with non-standard-Gaussian inputs
  - We show the local strong convexity around  $W^*$ .
- ② Generalization gap bound is required for the new input distribution
  - We establish new concentration bounds.
- The initialization method needs to be updated.
  - We develop a new version of tensor initialization with new tensor constructions.

3

イロト 不得下 イヨト イヨト

Settings

- *d* = 5.
- Generate  $W^*$  with each entry from  $\mathcal{N}(0,1)$ .
- Initialize  $W_0$  close to  $W^*$ .

#### GMM

- Sample complexity against feature dimension.
  - $\boldsymbol{x} \sim \frac{1}{2}\mathcal{N}(1, \boldsymbol{I}) + \frac{1}{2}\mathcal{N}(-1, \boldsymbol{I}).$
- Sample complexity/Convergence rate against mean value.

• 
$$\boldsymbol{x} \sim rac{1}{2}\mathcal{N}(\mu\cdot 1, \boldsymbol{I}) + rac{1}{2}\mathcal{N}(-\mu\cdot 1, \boldsymbol{I}).$$

Sample complexity/Convergence rate against variance value.

• 
$$\mathbf{x} \sim \frac{1}{2}\mathcal{N}(1, \mathbf{\Sigma}) + \frac{1}{2}\mathcal{N}(-1, \mathbf{\Sigma}).$$

 $\|\widehat{\boldsymbol{W}} - \boldsymbol{W}^*\|_F \text{ against } \sqrt{\log n/n}.$ 

• 
$$\mathbf{x} \sim rac{1}{2}\mathcal{N}(1,9\mathbf{I}) + rac{1}{2}\mathcal{N}(-1,9\mathbf{I})$$

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ● □ ● ○ ○ ○

• The boundary line of black and white parts is almost straight, indicating an approximate linearity between *n* and *d*.

• When *n* increases, i.e., when  $\sqrt{\log n/n}$  decreases, the distance between  $\widehat{W}$  and  $W^*$  decreases.

э

• The sample complexity increases with  $\mu$ .

- The sample complexity first decrease and then increase as  $\sigma$  increases.

・ロト ・ 同ト ・ ヨト ・ ヨト

э

Figure 5: Convergence rate with different  $\mu$ 

• Converges slower as  $\mu$  increases.

Figure 6: Convergence rate with different  $\Sigma$ 

• Converges fastest when 
$$\|\Sigma^{\frac{1}{2}}\|=1$$
.

∃ ► < ∃ ►</p>

# Conclusion and future work

- We study the problem of learning a fully connected neural network when the input features belong to the Gaussian mixture model from the theoretical perspective.
- We propose a gradient descent algorithm with tensor initialization, and the iterates are proved to converge linearly to a critical point with guaranteed generalization.
- We characterize the sample complexity for successful recovery, and the sample complexity is proved to be dependent on the parameters of the input distribution.
- Future direction: multi-layer neural networks and multi-task learning.

# Thank you!

Meng Wang (RPI)

19/24

#### Tensor initialization

- Estimate the subspace spanned by  $\{\boldsymbol{w}_1^*, \cdots, \boldsymbol{w}_K^*\}$ .
- **2** Estimate the direction of  $w_i^*$ ,  $i \in [K]$  using the KCL algorithm [Kuleshov et al., 2015].
- Setimate the magnitude of  $w_i$ ,  $i \in [K]$  by solving a linear system.
